1 Field Extensions II

Definition 1 (Smallest subring/subfield)**.** *Let $L : K$ with $K \subseteq L$.*

(i) When $\alpha \in L$, we denote by $K[\alpha]$ the smallest subring of L containing K and α, and by $K(\alpha)$ the smallest subfield of L containing K and α;

(ii) More generally, when $A \subseteq L$, we denote by $K[A]$ the smallest subring of L containing K and A, and by $K(A)$ the smallest subfield of L containing K and A.

Then

$$K[\alpha] = \left\{ \sum_{i=0}^{d} c_i \alpha^i : d \in \mathbb{Z}_{\leq 0},\ c_0, \ldots, c_d \in K \right\}$$
$$K(\alpha) = \{ f/g : f, g \in K[\alpha], g \neq 0 \}.$$

Definition 2 (Algebraic/transcendental element)**.** *Suppose that $L : K$ is a field extension with associated embedding φ. Suppose also that $\alpha \in L$.*

(i) We say α is algebraic over K if $\exists f_{\not\equiv 0} \in K[t]$ such that $f(\alpha) = 0$.

(ii) If α is not algebraic over K, then we say α is transcendental over K.

(iii) When every element of L is algebraic over K, we say that L is algebraic over K.

Definition 3 (Evaluation map)**.** *Suppose that $L : K$ is a field extension with $K \subseteq L$, and that $\alpha \in L$. We define the evaluation map $E_\alpha : K[t] \to L$ by putting $E_\alpha(f) = f(\alpha)$ for each $f \in K[t]$.*

Definition 4 (Minimal polynomial)**.** *Suppose that $L : K$ is a field extension with $K \subseteq L$, and suppose that $\alpha \in L$ is algebraic over K. Then the minimal polynomial of α over K is the unique monic polynomial μ_α^K having the property that $\ker(E_\alpha) = (m_\alpha(K))$.*

Lemma 1.1. *1. μ_α^K is irreducible over K;*

2. If $f \in K[t]$ such that $f(\alpha) = 0$, then $\mu_\alpha^K \,\big|\, f$;

3. If $f \in K[t]$ such that $f(\alpha) = 0$ and f is irreducible over K, then $\exists k \in K$ such that $f = k\mu_\alpha^K$.

Theorem 1.2. *Let $L : K$ with $K \subseteq L$, and suppose that $\alpha \in L$ is algebraic over K.*

(i) $K[\alpha]$ is a field, and $K[\alpha] = K(\alpha)$;

(ii) If $n = \deg \mu_\alpha^K$, then $\left\{1, \alpha, \alpha^2, \ldots, \alpha^{n-1}\right\}$ is a basis for $K(\alpha)$ over K ($\implies [K(\alpha) : K] = \deg \mu_\alpha^K$).

Theorem 1.3 (Rational Root Theorem)**.** *Let $\frac{p}{q}$ be a root of $f = a_0 t^n + \cdots + a_{n-1} t^{n-1} + a_n$, for $a_j \in \mathbb{Z}$, where p and q are coprime. Then $p \,\big|\, a_n$ and $q \,\big|\, a_0$.*

Note: If α is transcendental over K, then $K(\alpha) \cong K(x)$ (where x is a formal variable).

Corollary 1.4. *Let $L : K$ with $K \subseteq L$, and suppose that $\alpha \in L$ is algebraic over K. Then every element of $K(\alpha)$ is algebraic over K.*

Corollary 1.5. *Let $L : K$ with $K \subseteq L$. Then $[L : K] < \infty \iff L = K(\alpha_1, \ldots, \alpha_n)$ for $\alpha_j \in L$.*

Theorem 1.6. *Let $L : K$ be a field extension, and define*

$$L^{\text{alg}} = \{\alpha \in L : \alpha \text{ is algebraic over } K\}.$$

Then L^{alg} is a subfield of L.
