

## 1 Algebraic Closure II

**Theorem 1.1.** *Let  $E$  be an algebraic extension of  $K$  with  $K \subseteq E$ , and let  $\overline{K}$  be an algebraic closure of  $K$ .*

*Given a homomorphism  $\varphi : K \rightarrow \overline{K}$ , the map  $\varphi$  can be extended to a homomorphism from  $E$  into  $\overline{K}$ .*

**Theorem 1.2.** *If  $L$  and  $M$  are both algebraic closures of  $K$ , then  $L \cong M$ .*

**Corollary 1.3.** *Let  $L : K$  be an extension with  $K \subseteq L$ . Suppose that  $g \in L[t]$  is irreducible over  $L$ , and that  $g \mid f$  in  $L[t]$ , where  $f \in K[t] \setminus \{0\}$ . The  $g$  divides a factor of  $f$  that is irreducible over  $K$ .*

*Thus, there exists an irreducible  $h \in K[t]$  having the property that  $h \mid f$  in  $K[t]$ , and  $g \mid h$  in  $L[t]$ .*

**Definition 1** (Normal extension). *The extension  $L : K$  is normal if it is algebraic, and every irreducible polynomial  $f \in K[t]$  either splits over  $L$  or has no root in  $L$ .*

**Theorem 1.4.**  *$K(\alpha) : K$  is normal  $\iff$  all conjugates of  $\alpha$  are contained in  $K(\alpha)$ .*

**Theorem 1.5.** *A finite extension  $L : K$  is normal  $\iff$   $L$  is a splitting field extension for some  $f \in K[t] \setminus K$ .*
