## 1 Field extensions and algebraic elements

#### 1.1 Field extensions

**Definition 1** (Field extension). When K and L are fields, we say that L is an <u>extension</u> of K if there is a homomorphism  $\varphi: K \to L$ . We then talk about the field extension  $(\varphi, K, L)$ .

**Definition 2** (Degree, finite extension). Suppose that L: K is a field extension. We define the <u>degree</u> of L: K to be the dimension of L as a vector space over K. We use the notation [L:K] to denote the <u>degree</u> of L: K. Further, we say that L: K is a finite extension if  $[L:K] < \infty$ .

**Definition 3** (Tower, intermediate field). We say that M:L:K is a <u>tower</u> of field extensions if M:L and L:K are field extensions, and in this case we say that L is an <u>intermediate field</u> (relative to the extension M:K)

### 1.2 Algebraic elements

**Definition 4** (Algebraic/transcendental element). Suppose that L: K is a field extension with associated embedding  $\varphi$ . Suppose also that  $\alpha \in L$ .

- (i) We say that  $\alpha$  is algebraic over K when  $\alpha$  is the root of  $\varphi(f)$  for some non-zero polynomial  $f \in K[t]$ .
- (ii) If  $\alpha$  is not algebraic over K, then we say  $\alpha$  is transcendental over K.
- (iii) When every element of L is algebraic over K, we say that the field L is algebraic over K.

**Definition 5** (Evaluation map). Suppose that L: K is a field extension with  $K \subseteq L$ , and that  $\alpha \in L$ . We define the evaluation map  $E_{\alpha}: K[t] \to L$  by putting  $E_{\alpha}(f) = f(\alpha)$  for each  $f \in K[t]$ .

**Definition 6** (Minimal polynomial). Suppose that L: K is a field extension with  $K \subseteq L$ , and suppose that  $\alpha \in L$  is algebraic over K. Then the minimal polynomial of  $\alpha$  over K is the unique monic polynomial  $m_{\alpha}(K)$  in K[t] having the property that  $\ker(E_{\alpha}) = (m_{\alpha}(K))$ .

**Definition 7** (Smallest subring/subfield). Let L: K be a field extension with  $K \subseteq L$ .

- (i) When  $\alpha \in L$ , we denote by  $K[\alpha]$  the <u>smallest subring of L containing K and  $\alpha$ </u>, and by  $K(\alpha)$  the <u>smallest subfield of L containing K and  $\alpha$ </u>;
- (ii) More generally, when  $A \subseteq L$ , we denote by K[A] the <u>smallest subring of L containing K and A</u>, and by K(A) the smallest subfield of L containing K and  $\overline{A}$ .

# 2 Review of finite fields and tests for irreducibility

**Definition 8** (Characteristic). Let K be a field with additive identity  $0_K$  and multiplicative identity  $1_K$ . When  $n \in \mathbb{N}$ , we write  $n \cdot 1_K$  to denote  $1_K + \ldots + 1_K$  (as an n-fold sum). We define the <u>characteristic</u> of K, denoted by  $\operatorname{char}(K)$ , to be the smallest positive integer m with the property that  $m \cdot 1_K = 0_K$ ; if no such integer m exists, we define the characteristic of K to be 0.

**Definition 9** (Highest common factor, content, primitive). Let R be a UFD. When  $a_0, \ldots, a_n \in R$  are not all 0, we define as a <u>highest common factor</u> of  $a_0, \ldots, a_n$  (written  $hcf(a_0, \ldots, a_n)$ ) any element  $c \in R$  satisfying

- (i)  $c \mid a_i \ (0 \le i \le n)$ , and
- (ii) whenever  $d \mid a_i \ (0 \le i \le n)$ , then  $d \mid c$ .

When  $f = a_0 + a_1X + \ldots + a_nX^n$  is a non-zero polynomial in R[X], we define a <u>content</u> of f to be any  $hcf(a_0, \ldots, a_n)$ . We say that  $f \in R[X]$  is <u>primitive</u> if  $f \neq 0$  and the content of f is divisible only by units of R.

# 3 Extending field homomorphisms and the Galois group of an extension

# 3 Extending field homomorphisms and the Galois group of an extension

**Definition 16** (Extension of field homomorphism, isomorphic field extensions). For i = 1 and 2, let  $L_i : K_i$  be a field extension relative to the embedding  $\varphi_i : K_i \to L_i$ . Suppose that  $\sigma : K_1 \to K_2$  and  $\tau : L_1 \to L_2$  are isomorphisms. We say that  $\underline{\tau}$  extends  $\underline{\sigma}$  if  $\tau \circ \varphi_1 = \varphi_2 \circ \sigma$ . In such circumstances, we say that  $L_1 : K_1$  and  $L_2 : K_2$  are isomorphic field extensions.

When  $\sigma: K_1 \to K_2$  and  $\tau: L_1 \to L_2$  are homomorphisms (instead of isomorphisms), then  $\underline{\tau}$  extends  $\underline{\sigma}$  as a homomorphism of fields when the isomorphism  $\tau: L_1 \to L'_1 = \tau(L_1)$  extends the isomorphism  $\underline{\sigma}: K_1 \to K'_1 = \sigma(K_1)$ .

**Definition 17** (F-homomorphism). Let L: K be a field extension relative to the embedding  $\varphi: K \to L$ , and let M be a subfield of L containing  $\varphi(K)$ . Then, when  $\sigma: M \to L$  is a homomorphism, we say that  $\sigma$  is a K-homomorphism if  $\sigma$  leaves  $\varphi(K)$  pointwise fixed, which is to say that for all  $\alpha \in \varphi(K)$ , one has  $\sigma(\alpha) = \alpha$ .

## 4 Algebraic closures

### 4.1 The definition of an algebraic closure, and Zorn's Lemma

**Definition 18** (Algebraically closed field, algebraic closure). Let M be a field.

- (i) We say that M is algebraically closed if every non-constant polynomial  $f \in M[t]$  has a root in M.
- (ii) We say that M is an algebraic closure of K if M: K is an algebraic field extension having the property that M is algebraically closed.

**Definition 19** (Chain). Suppose that X is a nonempty, partially ordered set with  $\leq$  denoting the partial ordering. A <u>chain</u> C in X is a collection of elements  $\{a_i\}_{i\in I}$  of X having the property that for every  $i, j \in I$ , either  $a_i \leq a_i$  or  $a_j \leq a_i$ .

#### 4.2 The existence of an algebraic closure

**Definition 20** (Algebraic closure of K). When K is a field, an algebraic extension  $\overline{K}$ : K that is algebraically closed is called an algebraic closure of K.

# 5 Splitting field extensions

**Definition 21** (Splitting field, splitting field extension). Suppose that L: K is a field extension relative to the embedding  $\varphi: K \to L$ , and  $f \in K[t] \setminus K$ .

- (i) We say that f splits over L if  $\varphi(f) = \lambda(t \alpha_1) \cdots (t \alpha_n)$ , for some  $\lambda \in \varphi(K)$  and  $\alpha_1, \ldots, \alpha_n \in L$ .
- (ii) Suppose that f splits over L, and let M be a field with  $\varphi(K) \subseteq M \subseteq L$ . We say that  $\underline{M} : K$  is a splitting field extension for f if M is the smallest subfield of L containing  $\varphi(K)$  over which f splits.
- (iii) More generally, suppose that  $S \subseteq K[t] \setminus K$  has the property that every  $f \in S$  splits over L. Let M be a field with  $\varphi(K) \subseteq M \subseteq L$ . We say that M : K is a splitting field extension for S if M is the smallest subfield of L containing  $\varphi(K)$  over which every polynomial  $f \in S$  splits.

## 6 Normal extensions and composita

#### 6.1 Normal extensions

**Definition 22** (Normal extension). The extension L: K is <u>normal</u> if it is algebraic, and every irreducible polynomial  $f \in K[t]$  either splits over L or has no root in L.

#### 6.2 Composita of field extensions

**Definition 23** (Compositum). Let  $K_1$  and  $K_2$  be fields contained in some field L. The <u>compositum</u> of  $K_1$  and  $K_2$  in L, denoted by  $K_1K_2$ , is the smallest subfield of L containing both  $K_1$  and  $K_2$ .

## 7 Separability

**Definition 24** (Separable). Let K be a field.

- (i) An irreducible polynomial  $f \in K[t]$  is <u>separable over K</u> if it has no multiple roots, meaning that  $f = \lambda(t \alpha_1)(t \alpha_2) \cdots (t \alpha_d)$ , where  $\alpha_1, \ldots, \alpha_d \in \overline{K}$  are distinct.
- (ii) A non-zero polynomial  $f \in K[t]$  is <u>separable over K</u> if its irreducible factors in K[t] are separable over K.
- (iii) When L: K is a field extension, we say that  $\alpha \in L$  is <u>separable over K</u> when  $\alpha$  is algebraic over K and  $m_{\alpha}(K)$  is separable.
- (iv) An algebraic extension L: K is a separable extension if every  $\alpha \in L$  is separable over K.

## 8 Inseparable polynomials, differentiation, and the Frobenius map

### 8.1 Inseparable polynomials and differentiation

**Definition 25** (Inseparable). A polynomial  $f \in K[t]$  is inseparable over K if f is not separable over K, meaning that f has an irreducible factor  $g \in K[t]$  having the property that g has fewer than  $\deg g$  distinct roots in K.

**Definition 26** (Formal derivative). We define the derivative operator  $\mathcal{D}: K[t] \to K[t]$  by

$$\mathcal{D}\left(\sum_{k=0}^{n} a_k t^k\right) = \sum_{k=1}^{n} k a_k t^{k-1}.$$

#### 8.2 The Frobenius map

**Definition 27** (Frobenius map). Suppose that  $\operatorname{char}(K) = p > 0$ . The <u>Frobenius map</u>  $\phi : K \to K$  is defined by  $\phi(\alpha) = \alpha^p$ .

#### 9 The Primitive Element Theorem

**Definition 28** (Simple extension). Suppose L: K is a field extension relative to the embedding  $\varphi: K \to L$ . We say that L: K is a simple extension if there is some  $\gamma \in L$  having the property that  $L = \varphi(K)(\gamma)$ .

### 10 Fixed fields and Galois extensions

**Definition 29** (Fixed field). Let L: K be a field extension. When G is a subgroup of Aut(L), we define the fixed field of G to be

$$Fix(L(G)) = \{\alpha \in L : \sigma(\alpha) = \alpha \text{ for all } \sigma \in G\}.$$

**Definition 30** (Galois extension). When L: K is a field extension, we say that L: K is a <u>Galois extension</u> if it is an extension that is normal and separable.

## 11 The main theorems of Galois theory

#### 11.1 The Fundamental Theorem

**Definition 31.** Suppose that L: K is a field extension. When G is a subgroup of Aut(L), we write  $\phi(G)$  for  $Fix(_{1}L(G), and when <math>L: M: K_{0}$  is a tower of field extensions with  $K_{0} = \phi(Gal(L:K))$ , we write  $\gamma(M)$  for Gal(L:M).

**Definition 32** (Galois group of polynomial). When  $f \in K[t]$  and L : K is a splitting field extension for f, we define the Galois group of the polynomial f over K to be  $\operatorname{Gal}_K(f) = \operatorname{Gal}(L : K)$ .

## 12 Solvability by radicals: polynomials of degree 2, 3 and 4

**Definition 33** (Radical element/extension). Suppose that L: K is a field extension, and  $\beta \in L$ . We say that  $\beta$  is radical over K when  $\beta^n \in K$  for some  $n \in \mathbb{N}$  (so  $\beta = \alpha^{1/n}$  for some  $\alpha \in K$  and some  $n \in \mathbb{N}$ ). We say that  $\overline{L:K}$  is an extension by radicals when there is a tower of field extensions  $L = L_r: L_{r-1}: \cdots: L_0 = K$  such that  $L_i = \overline{L_{i-1}(\beta_i)}$  with  $\beta_i$  radical over  $L_{i-1}$ . We say  $f \in K[t]$  is solvable by radicals if there is a radical extension of K over which f splits.

# 13 Solvability and solubility

**Definition 34** (Soluble group). A finite group G is soluble if there is a series of groups

$$\{id\} = G_0 \le G_1 \le \dots \le G_n = G,$$

with the property that  $G_i \subseteq G_{i+1}$  and  $G_{i+1}/G_i$  is abelian  $(0 \le i < n)$ .

**Definition 35** (Cyclic extension). The extension L: K is <u>cyclic</u> if L: K is a Galois extension and Gal(L: K) is a cyclic group.
