1   Field Extensions I

Definition 1 (Integral domain)**.** Let R be a commutative ring. Then R is <u>an integral domain</u> if $ab = 0$ implies that $a = 0$ or $b = 0$ for all $a, b \in R$.

Definition 2 (Euclidean domain)**.** Let R be an integral domain. Then R is a <u>Euclidean domain</u> if there exists some function $f : R \setminus \{0\} \to \mathbb{Z}_{\geq 0}$ such that for all $a, b_{\neq 0} \in R$, there exist elements $q, r \in R$ such that $a = qb + r$ where $r = 0$ or $f(r) < f(b)$.

Theorem 1.1 (Bézout's Identity)**.** *Let R be a Euclidean domain. For $a, b \in R$, there exists $\alpha, \beta \in R$ such that $\gcd(a, b) = \alpha a + \beta b$*

Definition 3 (Irreducible)**.** Let F be a field, and $f \in F[t] \setminus F$. Then f is <u>irreducible</u> if $\nexists g, h \in F[t] \setminus F$ of strictly smaller degree such that $f = gh$.

Definition 4 (Unique factorization domain)**.** Let R be an integral domain. Then R is <u>a unique factorization domain (UFD)</u> if for irreducible $p_i \in R$, any nonzero $x \in R$ can be written uniquely (up to ordering) as $x = p_1 p_2 \cdots p_k, \quad k \geq 1$.

Fact: If R is an Euclidean domain, then R is a UFD (and PID)

Corollary 1.2. *Let $f \in \mathbb{F}[t]$ be a monic polynomial with $\deg f \geq 1$. Then we can write $f = f_1 f_2 \cdots f_k$ uniquely (up to ordering) for irreducible monic polynomials f_j.*

Definition 5. Let R be a UFD. When $a_0, \ldots, a_n \in R$ are not all 0, we can generalize the <u>greatest common divisor</u> of $a_0, \ldots, a_n$ (written $\gcd(a_0, \ldots, a_n)$) any element $c \in R$ satisfying

   (i) $c \mid a_i \ (0 \leq i \leq n)$, and

   (ii) if $d \mid a_i \ (0 \leq i \leq n)$, then $d \mid c$.

When $f = \sum_{j=0}^{d} a_j x^j \in R[x]$ is a non-zero polynomial, we define a <u>content</u> of f to be any $\gcd(a_0, \ldots, a_d)$ and $\underline{\gcd(f)} = \gcd(a_0, \ldots, a_d)$. We say that $f \in R[X]$ is <u>primitive</u> if $f \neq 0$ and the content of f is divisible only by units of R.

Lemma 1.3 (Gauss)**.** $\gcd(fg) = \gcd f \cdot \gcd g$

Corollary 1.4. *$f \in \mathbb{Z}[t]$ is irreducible $\iff$ f is irreducible over $\mathbb{Q}[t]$*

Corollary 1.5. *If R is a UFD with field of fractions Q and $f \in R[X]$ with $\deg f > 0$, then f is irreducible in $R[X] \iff f$ is irreducible in Q.*

Theorem 1.6 (Eisenstein's Criterion)**.** *Let R be a UFD with field of fractions Q and let $f = a_0 + a_1 X + \ldots + a_n X^n \in R[X]$ with $\gcd(f) = 1$. Suppose there exists an irreducible element $p \in R$ such that*

   (i) $p \mid a_i$ for $0 \leq i < n$,

   (ii) $p^2 \nmid a_0$, and

   (iii) $p \nmid a_n$,

then f is irreducible in $R[X]$ (and hence also in $Q[X]$).

Definition 6 (Field extension)**.** Let L and K be fields. Then L is an <u>extension</u> of K if there exists a homomorphism $\varphi : K \to L$. Then we write $L : K$ or L/K, $\varphi(K) \cong K$ and identify $\varphi(K)$ with K.

Fact: Suppose that L is a field extension of K with associated embedding $\varphi : K \to L$. Then L forms a vector space over K, under the operations

$$\text{(vector addition) } \psi : L \times L \to L \quad \text{given by} \quad (v_1, v_2) \mapsto v_1 + v_2$$
$$\text{(scalar multiplication) } \tau : K \times L \to L \quad \text{given by} \quad (k, v) \mapsto \varphi(k)v.$$

Definition 7 (Degree, finite extension)**.** Let $L : K$. Then the <u>degree</u> of $L : K$ is $[L : K] = \dim L$ over K as a vector space. We say that $L : K$ is a <u>finite extension</u> if $[L : K] < \infty$.

Definition 8 (Tower, intermediate field)**.** We say that $M : L : K$ is a <u>tower</u> of field extensions if $M : L$ and $L : K$ are field extensions, and in this case we say that L is an <u>intermediate field</u> (relative to the extension $M : K$)

Theorem 1.7 (The Tower Law). *Suppose that $M : L : K$ is a tower of field extensions. Then $M : K$ is a field extension, and $[M : K] = [M : L][L : K]$.*

Corollary 1.8. *Suppose that $L : K$ is a field extension for which $[L : K]$ is a prime number. Then whenever $L : M : K$ is a tower of field extensions with $K \subseteq M \subseteq L$, one has either $M = L$ or $M = K$.*
