1 Cyclotomic Polynomials

Theorem 1.1. *For prime p, we have $x^p - 1 = (x-1)(x^{p-1} + \cdots + 1)$ and $\mu_{\varepsilon_p}^{\mathbb{Q}} = x^{p-1} + \cdots + 1$.*

Definition 1 (n^{th} cyclotomic polynomial)**.**

$$\Phi_n(x) = \prod_{\substack{\varepsilon \in \sqrt[n]{1} \\ |\varepsilon| = n}} (x - \varepsilon) = \frac{x^n - 1}{\prod_{d \mid n, d < n} \Phi_d(x)}$$

Theorem 1.2. *Φ_n is irreducible over $\mathbb{Q}$.*

Corollary 1.3.   (a) $[\mathbb{Q}(\exp\left(\frac{2\pi i}{n}\right)) : \mathbb{Q}] = \varphi(n)$ *(where φ is Euler's totient function);*

   (b) $[\mathbb{Q}(\cos\left(\frac{2\pi}{n}\right)) : \mathbb{Q}] = \frac{1}{2}\varphi(n)$. *Furthermore, all algebraic conjugates of $\cos\frac{2\pi}{n}$ are $\cos\frac{2\pi k}{n}$ for* $\gcd(k, n) = 1$.

   (c) *Let $c = \frac{a+bi}{a-bi} \in \sqrt[\infty]{1}$, where $a, b \in \mathbb{Z}$. Then $c \in \{\pm i, \pm 1\}$*

Lemma 1.4. *Let $\mathbb{F}$ be a finite field. Then $\mathbb{F}^{\times} = \mathbb{F} \setminus \{0\}$ is a cyclic group.*
